Subject: Phase I and Limited Phase II Environmental Site Assessment

55 Laguna Street

San Francisco, California

Dear Ms. Jordan:

We are pleased to submit our Phase I and Limited Phase II Environmental Site Assessment for 55 Laguna Street property. We appreciate the opportunity to be of service to you on this project. If you have any questions or require additional information, please call.

Sincerely yours,

TREADWELL & ROLLO, INC.

PHASE I AND LIMITED PHASE II ENVIRONMENTAL SITE ASSESSMENT 55 LAGUNA STREET San Francisco, California

1.0 INTRODUCTION AND SCOPE

This report, prepared for A.F. Evans Development, Inc. presents the results of Treadwell & Rollo Inc. Phase I and Limited Phase II Environmental Site Assessment (ESA) for the property at 55 Laguna Street (Site) in San Francisco, California (Figure 1). The Site is bounded by Haight Street on the north, Hermann Street on the south, Laguna Street on the east, and Buchanan Street on the west. The Site is rectangular in shape and has approximate plan dimensions of 400 feet by 600 feet and is currently occupied by four buildings.

As shown on Figure 2, Woods Hall, Woods Hall Annex, and Middle Hall occupy the northwest portion of the site. Richardson Hall is an L-Shaped building located in the southeast portion of the site. The remaining area is occupied by asphalt parking, play areas, concrete sidewalks, and landscaped areas. A Dental Clinic occupies the southwest corner of the Site but is not part of our report. The remaining areas consist of three terraced parking lots, landscaped areas, and sidewalks. The scope of our work for this Phase I and Limited Phase II ESA consisted of:

The scope of our work consisted of:

- Reviewing readily available documents and maps regarding local geologic and hydrogeologic conditions;
- Reviewing readily available historical aerial photographs, historical maps (Sanborn Fire Insurance Maps), and United States Geological Survey (USGS) historical topographic maps for the Site;
- Performing a reconnaissance survey of the Site and a survey of the area within a 1/4-mile radius of the Site, as accessible, to make visual observations of existing Site conditions, activities, types of land use, and businesses within the search area:

- Reviewing local, state, and federal records provided by Environmental Data Resources, Inc. (EDR) of Southport, Connecticut, for government databases pertinent to Phase I ESAs;
- Conducting inquires by telephone, visit, and/or written correspondence to the San
 Francisco Fire Department (SFFD) and San Francisco Department of Public Health
 (SFDPH) as appropriate, regarding environmental permits, environmental violations,
 incidents and/or status of enforcement actions at the Site;
- Drilling eight exploratory borings;
- Analyzing selected soil samples for chemical constituents; and
- Preparing this report.

2.0 SITE AND PROJECT DESCRIPTION

The Site has dimensions of about 400 by 600 feet and is currently occupied by five buildings. The proposed development is discussed below:

- Northwest Portion Woods Hall and Woods Hall Annex will likely remain on-site and be upgraded. Middle Hall will be demolished. A two-story building with one or two wings will be constructed south of Woods Hall. The new building will have a belowgrade parking level extending beneath the entire structure.
- Northeast Portion The proposed development in this area includes a wood-framed, four-story building with one level of below-grade parking.
- Southwest Portion The Dental Building will likely remain on-site; however, if the Dental Building is removed, 3- to 4-level townhouses with a below-grade parking level will be constructed in this area.
- Southeast Portion A mixed-use development structure is being considered for this area.
 The structure will consist of seven levels of steel and concrete construction, or concrete construction, over two levels of below-grade parking.

As shown on Figure 2, the Site is bounded by Haight Street to the north, Hermann Street to the south, Laguna Street to the east, and Buchanan Street to the west.

The Site is at an elevation ranging from about 170 feet Mean Sea Level (MSL) at the corner of Haight and Buchanan Street to about 90 feet MSL at the corner Laguna and Herrmann Streets and slopes downward in a southeasterly direction. A topographic map of the vicinity is presented on Figure 3. Land use in the immediate vicinity of the Site is mainly residential.

3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

The results of our recent investigation and the available subsurface information indicate primarily fill, dune sand, sand and clay, and bedrock underlie the site. The fill, where encountered, typically consists of 1 to 8 feet of loose to medium dense sand with varying amounts of silt and clay, and medium stiff clay. The fill is thickest behind the site retaining walls. Up to 17 feet of fill was encountered beneath the upper parking lot west of a wooden bulkhead (north of the Dental Building). The fill was likely placed before the 1940s; there are no records regarding its placement and compaction. Directly beneath the pavement, or beneath the fill and Dune sand, is medium dense to dense clayey sand; stiff to hard clay and sandy clay; or dense to very dense gravel. The clay, sand, and gravel, where encountered in the borings, vary from 1 to 17 feet in thickness.

The fill and native soil are underlain by Franciscan Melange bedrock, consisting of a highly sheared mixture of serpentinite, shale and sandstone. The bedrock is completely to deeply weathered, low to moderately hard, friable to moderately strong. Bedrock was encountered in the borings between 2 and 27 feet bgs; the large variation in depth to rock is likely due to previous cut and fill site grading to create level building pads.

Groundwater was encountered in two of the borings drilled in the upper and lower parking lots during the 1988 field investigation. The water level measured in the two borings was at 18 and 22 feet bgs, corresponding to Elevation 123 and 99 feet, respectively. The groundwater level during our field investigation was measured in one of the borings drilled within the central parking lot at a depth of about 12 feet bgs (near Elevation 96 feet). The groundwater level at the site will fluctuate with seasonal changes in rainfall. On the basis of the available information, we

anticipate the high groundwater level at the site may be perched on top of the bedrock or may exist in fractures within the rock. Regional groundwater flow is believed to be in the southeastern direction.

4.0 SITE USAGE HISTORY

The history of the Site and vicinity was reviewed to identify activities at the Site and adjacent facilities that may have released hazardous materials into the subsurface. To accomplish this objective, we reviewed readily available environmental and geotechnical reports and historical Sanborn Fire Insurance Maps for the years 1886, 1899, 1913, 1950, 1967, 1974, 1987, 1989, and 1991 and historical topographic maps for the years 1932, 1948, 1956, 1966, and 1993 and 2000. Copies of 1886, 1913, 1950, and 1987 Sanborn Maps are included in Appendix A.

The 1886 Sanborn Map shows the Site occupied with a School House for the San Francisco Protestant Orphan Asylum located in the northwest corner. The San Francisco Protestant Orphan Asylum is present to the southwest of the Site. The remainder of the Site is vacant land. Land use to the north of the Site is occupied by six residential properties. No coverage is available to the west, east, or south of the Site. The 1899 Sanborn map shows the Site unchanged from the 1886 Sanborn map. A copy of the 1886 Sanborn Map is presented on Figure A-1.

The 1913 Sanborn Map shows the Site relatively unchanged with the exception of the title of the school house replaced with the State Normal School and the addition of classrooms to the north and south. A chapel is present to the east of the San Francisco Protestant Orphan Asylum. The areas to the west and north are developed with several residential buildings. Land use to the south is shown as vacant land. No coverage is available to the east of the Site. A copy of the 1913 Sanborn Map is presented on Figure A-2.

The 1950 Sanborn Map shows the Site as changed from the 1913 Sanborn Map. San Francisco State College now occupies the Site. The northern portion of the Site has an L-shaped configuration with classroom buildings and a gymnasium present to the immediate south of the configuration. The southern and northeast portions of the Site are occupied by rectangular

buildings labeled classrooms. A nursery school is present to the east of the northeast structure. The United States Mint is present to the southwest of the Site. Residential structures occupy the land use to the south of the Site. Areas to the north and west are occupied with residential structures. No coverage is shown to the east of the Site. A copy of the 1950 Sanborn map is presented on Figures A-3.

The 1967 and 1974 Sanborn map shows the Site occupied by University of California Extension School. Wood Hall is occupied to the northwest of the Site as part of the larger L-shaped configuration labeled as classrooms. The former gymnasium is labeled as an auditorium. An Administration building and classrooms are present in the southeast corner of the Site. The remainder of the Site is vacant land. Surrounding properties remain unchanged from the previous Sanborn map.

The 1987 Sanborn maps show the Site as it appears on the 1974 Sanborn map with the addition of a Dental Clinic located in the southwest corner of the Site, and a rectangular structure in the northeast of the Site. Surrounding properties remain unchanged. No coverage is shown to the east of the Site on the 1967, 1974, and 1987 Sanborn maps. The 1989 and 1991 Sanborn maps show the Site and surrounding properties as unchanged from the 1987 Sanborn map. A copy of the 1987 Sanborn map is presented on Figure A-4.

5.0 REVIEW OF PUBLIC RECORDS

A government records report for the Site was prepared by EDR. This report, which is attached as Appendix B, contains the results of a search of several government database sources pertinent to Phase I and Limited Phase II ESAs which identify potential sources of hazardous substances that may affect the soil and/or groundwater quality at the Site. These regulatory lists include sites where an unauthorized release is a potential hazard, where an unauthorized release is suspected to have occurred, and where an unauthorized release has been confirmed. The regulatory lists also include sites where hazardous materials are generated and/or stored, whether or not there has been an unauthorized release.

The search included businesses or properties on these government lists within a one-mile radius of the Site. The EDR report provides a comprehensive listing of agency records. There may be multiple entries for one site location on a single agency list, or a site may be identified on more than one list. Many sites are identified on the various agency lists because of previous problems or the potential for future problems. Also, sites identified may have been categorized by the listing regulatory agency as needing no further action, closed, or low priority. These sites would not likely have affected the soil or groundwater at the Site and the regulatory files (if any) on these sites were not reviewed as part of this scope of work.

On the basis of the information provided in the preliminary database search, Treadwell &Rollo reviewed regulatory agency case files for the sites with the potential to detrimentally affect the environmental conditions at the Site. Our findings are summarized below.

5.1 Site

The 55 Laguna Street property was listed on regulatory agency databases searched by EDR as a Haznet¹, RCRIS-SQG², and FINDS³ database. Small quantities of photo chemicals and photo

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

processing waste were previously generated in the former UC Darkroom and were recycled. No records were found at the SFDPH and SFFD files regarding fuel or hazardous material uses, or releases at the subject Site.

5.2 Nearby Facilities

Public files were reviewed for sites in close proximity and in the assumed up-gradient or cross-gradient direction of groundwater flow to the Site to evaluate the potential for these sites to affect the conditions at the subject property. Near-surface groundwater flow would be expected to serve as the chief transport mechanism for the migration of off-site chemical impacts to the on-site environment. The potential for these sites to affect the subject property is largely based on their relative location and the regional groundwater flow direction which has been identified to be in the southeastern direction. Our summaries of these reviews are presented below:

5.2.1 300 Buchanan Street

This facility, approximately 300 feet north-northwest and up gradient of the Site, was listed on the State of California registered leaking underground storage tank (LUST)⁴ site and Haznet. One 1,500-gallon heating oil underground storage tank (UST) was located under the sidewalk along the Haight Street Frontage of the property. On 14 February 2002, the tank was removed and soil samples were collected and analyzed for total petroleum hydrocarbons (TPH) as diesel (TPHd), benzene, toluene, ethylenes, and xylenes (BTEX), and methyl-tert-butyl-ethyl (MTBE). No TPHd, BTEX, or MTBE were detected at or above method reporting limits. No groundwater was encountered and remedial action completion certification was granted by SFDPH on 25 April 2002, with no further action related to petroleum releases at the site required. The potential for this release to affect the environmental conditions at the Site is considered minimal based on no groundwater encountered and the granting of administrative case closure.

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

5.2.2 364 Haight Street

This facility, approximately 275 feet north-northwest and upgradient of the Site, was listed on the State of California LUST, Cortese⁵, and CA FID UST⁶ sites. One 1,000-gallon heating oil UST was removed and disposed from the site on 6 November 1987. Following removal of the UST, groundwater and soil samples were collected and analyzed for TPHd, MTBE, and BTEX. TPHd was detected at a concentration of 940 parts per million (ppm) in the groundwater sample, and no concentrations were detected at or above method reporting limits in any of the soil samples. The TPHd detected in the groundwater sample was attributed to either a hole in the tank that went undetected or from previous overfilling of the tank. The groundwater that was encountered during the UST excavation activities was believed to be from a former cracked clay drainage pipe. Case closure with no further action was granted by the SFDPH on 24 January 1996. The potential for this release to affect the environmental conditions at the Site is considered minimal based on the distance to the subject Site and the granting of administrative case closure.

5.2.3 55 Hermann Street

This facility, approximately 450 feet south and crossgradient of the Site, was listed on the State of California LUST and HAZNET sites. One 1,500-gallon heating oil UST was removed from the site on 8 August 2002. Following removal of the UST, one soil sample was collected from each end of the tank and an additional four-point composite soil sample was collected from the stockpile containing overburden soil. All soil samples were analyzed for TPHd, BTEX, and MTBE. No concentrations of any of the analyzed constituents were detected at or above method reporting limits. On 25 November 2002, the SFDPH issued remedial action completion certification with no further action required. The potential for this release to affect the

CA FID: The Facility Inventory Database contains active and inactive underground storage tank locations. The source is the State Water Resource Control Board. A review of the CA FID UST list, as provided by EDR, has revealed that there are 13 CA FID UST sites within approximately 0.125 miles of the target property.

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

environmental conditions at the Site is considered minimal based on the distance to the subject Site, no groundwater encountered, and the granting of administrative case closure.

6.0 SITE RECONNAISSANCE

Treadwell & Rollo representatives conducted a reconnaissance of the Site and nearby area. The Site consists of four separate buildings, parking, sidewalks, and landscaped areas as shown on Figure 2. The four buildings located on the Site are called: Woods Hall, Woods Hall Annex, Middle Hall, and Richardson Hall. The purpose of the reconnaissance was to look for visual evidence of past or present use or storage of petroleum products and hazardous materials that could potentially affect soil and/or groundwater quality at the subject property.

Woods Hall is a two-story concrete building and is approximately 27,000 square feet in area. The first and second floors consisted of mainly classrooms, offices, small storage closets, and hallways. Woods Hall Annex is a two-story concrete building and is approximately 13,750 square feet in area which consisted of a mechanical room and classrooms. Middle Hall is a two-story concrete building approximately 11,600 square feet in area and consists mainly of a gymnasium. Limited amounts of cleaning supplies, paints, degreasers, and soap were located within the buildings.

Richardson Hall is a two-story concrete building above one basement level and is approximately 40,000 square feet in area. The basement level occupies approximately half of Richardson Hall building layout. The first and second floors of Richardson Hall consist mainly of classrooms, offices, storage closets, and an auditorium. The basement consists of storage areas, mechanical, and boiler rooms.

Hazardous materials are stored and used in the basement mechanical and boiler room areas. Small quantities of hazardous materials in consumer size containers (5-gallon or smaller) such as paints, carpet adhesive and lube oils and cleaning supplies are kept at the Site for use by the

previous janitorial and maintenance staff. Also, approximately three 60-gallon and four 5-gallon containers of anti-scaling and biocide chemicals were located near the boiler unit.

At the time of our inspection, the asphalt paved parking areas, sidewalks, and landscaped areas appeared to be in fairly good condition.

No visual evidence of any significant staining, spillage, and/or ponded liquids or uncontained solids were observed at the Site.

6.1 Nearby Area

The neighboring properties as observed from public sidewalks, were occupied by primarily residential properties, with some commercial properties, and surface streets. No apparent signs of chemical releases or leaks were noted here or at any nearby facilities.

7.0 LIMITED PHASE II ENVIRONMENTAL SITE INVESTIGATION

We performed a limited subsurface investigation to assess the presence of regulated chemical compounds in the soil beneath the Site. On 16, 17, and 22 March 2004, a total of eight exploratory borings, B-1 through B-8, were drilled at locations shown on Figure 2. The borings were drilled to depths of about 15 feet below the existing ground surface (bgs) using hollow-stem augers. The depths of the borings were selected based on the proposed depth of the foundation system to be used during future construction. Boring logs are presented in Appendix C.

7.1 Subsurface Soil Sampling

Three to four soil samples were obtained from borings B-1 through B-8 at depths of about 3, 5, 10, and 15 feet below ground surface (bgs) (i.e. B-1-3.0, B-1-5.0, B-1-10.0, and B-1-15.0 from boring B-1). Soil samples were obtained using a Sprague & Henwood (S&H) sampler with a 3.0-inch-outside diameter and 2.43 - inch - inside diameter. After the samples were collected,

the sample ends were covered with Teflon, sealed with plastic end caps, labeled, and stored in an ice-cooled chest for delivery to the analytical laboratory. All samples were delivered under chain-of-custody control to McCampbell Analytical, Inc., (McCampbell) a California Department of Health Services certified analytical laboratory in Pacheco, California.

8.0 SAMPLE SELECTION AND ANALYTICAL TESTING

Plans for the proposed construction of the new building include either a one or two level basement level and based on this information, soil samples were analyzed for the presence of petroleum hydrocarbons by EPA Method 8015M, semi-volatile organic compounds (SVOCs) by EPA Method 8270, volatile organic compounds (VOCs) by EPA Method 8260, asbestos, and metals by EPA Methods 6010/7000 series. The selected analyses are typically for the past site usage and possible landfill acceptance requirements.

9.0 LABORATORY TEST RESULTS AND EVALUATION

A summary of the laboratory analytical results are presented on Tables 1 and 2. Copies of the certified laboratory analytical reports are presented in Appendix D. Analytical results for TPH as gasoline (TPHg), VOCs, and SVOCs were not detected at or above the method reporting limits. Low levels of TPH as motor oil (TPHmo) were detected at concentrations of 8.8 milligrams per kilograms (mg/kg), 280 mg/kg, and 11 mg/kg from soil samples B-3-5, B-4A-1.5, and B-5-5, respectively. Low levels of TPH as diesel (TPHd) were detected at concentrations of 1.5 mg/kg, 30 mg/kg, and 5.9 mg/kg from soil samples B-3-5, B-4A-1.5, and B-5-5, respectively. Chrysotile asbestos was detected in one soil sample at <1% from sample B-3-15.5. The metal concentrations appeared to be within normal background ranges found in the western United States. An elevated total lead concentration was detected at from sample B-7-5 at a concentration of 350 mg/kg.

[&]quot;U.S.G.S. Professional Paper 1270, Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States," 1984.

10.0 DISCUSSION AND CONCLUSIONS

This Phase I and Limited Phase II ESA has been performed by Treadwell & Rollo, Inc. for A.F. Evans, for the property located at 55 Laguna Street, San Francisco, California. At the time of this study, the subject Site consists of four separate buildings, parking areas, landscape, and sidewalks. The Site was developed in the 1920's for San Francisco State as a school campus and has been used mainly as a campus since.

The Site is bounded by Haight Street on the north, Hermann Street on the south, Laguna Street on the east, and Buchanan Street on the west. Land use in the immediate vicinity of the Site is primarily residential.

The Site was listed on regulatory agency databases compiled by EDR. Small quantities of photo chemicals and photo processing waste were previously generated and recycled for the Site. No records were found at the SFFD or SFDPH offices relating to fuel or hazardous materials releases at the Site.

There are several facilities within the study area that appear on the regulatory agency lists. There is no readily available evidence that these facilities have affected nor are likely to affect the environmental conditions of the Site.

The Site is underlain with fill, dune sand, sand and clay, and bedrock. The fill, where encountered, ranged in thickness from 1 to 8 feet below the ground surface (bgs). The fill and native soil are underlain by bedrock. The bedrock was encountered at depths ranging from 2 to 27 feet bgs. Groundwater varies across the Site and was encountered at depths ranging from 12 to 20 feet bgs.

Analytical results of the near surface soil samples collected from eight shallow borings drilled throughout the Site indicated very low levels of motor oil and diesel detected. With the

exception of the lead concentration (350 mg/kg) in one shallow soil sample (B-7-5), the metal concentrations were within normal background levels.

The serpentinite encountered in some borings contains natural asbestos fibers, which may be a health risk when airborne. During a previous investigation, two test samples of the serpentinite encountered onsite indicated the rock contained two percent asbestos by weight. During our investigation, we tested 10 samples of serpentinite rock. Only one of the samples tested contained asbestos; the asbestos concentration in the sample was less than one percent by weight.

Based on our review of regulatory files, site history, and site reconnaissance, and subsurface investigation, our assessment revealed two possible recognized adverse environmental conditions in connection with the Site.

- Some of the fill material contained low levels of petroleum hydrocarbons and one soil sample analyzed contain an elevated lead concentration.
- Some of the samples analyzed of the serpentinite rock contained asbestos.

A Soil Management Plan (SMP) may be required for use during the site excavation to reduce worker and public exposure to these compounds. The SMP will outline proper soil handling and disposal options, and worker health and safety training requirements during construction activities.

11.0 LIMITATIONS

Activities undertaken as part of this investigation were conducted to provide preliminary information and data as input to possible decisions about the Site. Information obtained from government agencies and current property owner are dependent upon the quality of the information obtained.

Descriptions of specific field activities and historical events are based on our observations and on information provided by others. Opinions and recommendations presented herein apply to Site

conditions existing at the time of our assessment, and cannot necessarily be taken to apply to Site changes or conditions of which we are not aware and have not had the opportunity to evaluate. The conclusions presented in this report are professional opinions based on the specific activities conducted. Treadwell & Rollo, Inc. makes no guarantees or warranties with respect to the accuracy or completeness of this information.

The assessment did not include testing for the presence of lead paint, asbestos, PCBs in transformers or other electrical equipment, or naturally occurring environmental hazards (e.g., radon). The assessment did not address non-chemical hazards, such as the potential for seismic hazards at the Site.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property. Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in bold italics are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs): generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs): generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs): generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRIS-LQG list, as provided by EDR, and dated 01/12/2004 has revealed that there is 1 RCRIS-LQG site within approximately 0.25 miles of the target property.

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment orogram, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 54 Cortese sites within approximately 0.5 miles of the target property.

STATE OR LOCAL ASTM SUPPLEMENTAL

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, has revealed that there are 48 HAZNET sites within approximately 0.25 miles of the target property.

SAN FRANCISCO, CA 94103

Background Info: The site is owned by BMW of San Francisco and is located in

an industrial area. Previous site investigations found that the site soils were contaminated with lead. BMW terminated the agreement with the intent that the City and County of

San Francisco would oversee the removal.
